Landscaped shorelines can protect and beautify the waterfront.

A well designed shorescape using native plants provides a functional, low maintenance solution to address water quality, erosion, invasive plants and nuisance wildlife.

Using plants with a variety of color, size and texture can create a habitat for bees and butterflies, and add value to the property.

Some of South Carolina’s many native plants suited for shorescapes are shown here. Note that the waterfront has three distinct zones, and that certain plants are best suited for each zone based on their water needs.
